Open Peer Review

PeerJ is a formally peer-reviewed journal. All publications in the journal undergo a single-blind peer review process where reviewers know the identity of the authors but authors do not, by default, know the identity of the reviewers.

However, *PeerJ* encourages full transparency in the peer review process via a process sometimes known as 'open peer review'. This takes two forms:

1 Peer reviewers are encouraged (but not required) to provide their names to the authors when submitting their peer review. If they agree to provide their name, then their personal profile page will reflect a public acknowledgement that they performed a review (even if the article is rejected). If the article is accepted, then reviewers who provided their name will be associated with the article itself.

2 Authors are given the option to reproduce the complete peer review history of their article alongside the final publication of the article. If they choose this option then all submitted manuscript files, peer review comments, author rebuttals and revised materials are provided as a downloadable package. This is an all-or-nothing option; no text is edited or removed. Therefore, if the reviewers agreed to provide their name to the authors then their name will become part of this published record as well.
